

STEPPOWER · QUITO

# Turning pedestrian footsteps into clean energy.

Quito’s busiest steps can keep critical spaces alive when the grid goes dark.

**Movement → resilience**

Made with GAMMA

THE PROBLEM

# Quito’s blackouts turn movement into risk and lost revenue

**“Apagones” stop retail operations and disrupt customer flow.**

Dark transit corridors create safety risks for commuters and staff.

Diesel generators are expensive, noisy, carbon-heavy, and slow to deploy.

Made with GAMMA

THE SOLUTION

# StepPower makes every high-footfall step count

Pressure becomes local power for the services that matter first.

**01**

## Footstep pressure

A durable piezoelectric tile flexes under each step.

**02**

## Micro-power

Mechanical movement becomes decentralized micro-power.

**03**

## Critical services

Stored energy supports emergency LEDs, digital wayfinding, and phone-charging hubs.

Zero diesel fuel costs during use

Zero direct carbon emissions at the point of generation

Made with GAMMA

FIELDWORK · QUITO

# Fieldwork shows a clear, urgent customer need

**85.7%**

experience weekly power disruptions

**74.3%**

want an alternative to diesel generators

**45.7%**

prioritize emergency transit and corridor lighting

**Initial target sites:** Metro de Quito stations such as Iñaquito and Quitumbe, plus high-footfall Quicentro Shopping.

Fieldwork survey of Quito commuters and businesses · methodology note retained for pilot validation.

PROVEN BEHAVIOR

# Global hubs have already proven the behavior

StepPower adapts proven footstep energy to Quito’s blackout resilience gap.

## London

Pavegen flooring at Bird Street and West Ham station generated up to 5W per step for street lamps and Bluetooth beacons.

## Tokyo

JR East station mats captured rush-hour footsteps to support ticket gates and digital displays.

## Abu Dhabi

Airport terminal footstep energy supports lighting and wayfinding screens around the clock.

**Quito opportunity: resilience where footfall already exists**

Made with GAMMA

BUSINESS MODEL

# Start with high-footfall infrastructure, then scale site by site

## B2G

Sell or lease tile grids to municipal transit operators for stations, corridors, and emergency systems.

## B2B

Sell or lease systems to mall and commercial-property managers seeking resilience and ESG value.

**01**

01 · Pilot

One Metro station and one mall.

**02**

02 · Measure

Uptime and footfall become the proof.

**03**

03 · Expand

Multi-site contracts follow what works.

Revenue comes from tile-grid installation, monitoring, maintenance, and recurring service agreements.

INVESTOR LENS

# StepPower turns resilience into measurable ESG value

**Start with targeted emergency loads.**

Prove operating savings and uptime.

Expand the addressable footprint.

## Cost resilience

Reduce reliance on diesel backup for critical lighting and wayfinding.

## Pilot → proof → portfolio

Turn measured performance into a repeatable site strategy.

## ESG value

Give property managers a visible clean-energy story customers can experience.

## Green brand

Build a differentiated platform around resilience, safety, and sustainability.

Made with GAMMA

THE PILOT ASK

# Fund the Quito pilot — and make the next blackout different

**01** Deploy

One Metro de Quito station and one high-footfall mall.

**02** Power

Emergency LEDs, wayfinding, and phone charging during disruptions.

**03** Measure

Footfall, generated power, uptime, diesel displacement, and customer response.

**Investment ask: pilot funding + strategic site access**

# When Quito keeps moving, critical places keep working.
